Summary #1/2: Compiler techniques for parallelism

- Loop unrolling $\Rightarrow$ Multiple iterations of loop in SW:
 - Amortizes loop overhead over several iterations
 - Gives more opportunity for scheduling around stalls
- Very Long Instruction Word machines (VLIW)
 - $\Rightarrow$ Multiple operations coded in single, long instruction
 - Requires sophisticated compiler to decide which operations can be done in parallel
 - Trace scheduling $\Rightarrow$ find common path and schedule code as if branches didn't exist (+ add "fixup code")
- All of these require additional registers

CS 152 L16 Adv. Pipe. 2 (2)

Patterson Fall 2003 © UCB

Your Project Choice

- Superpipelined
- Superscalar
- Out-of-order execution

CS 152 L16 Adv. Pipe. 2 (3)

Patterson Fall 2003 © UCB

Reduce pipeline stalls for cache miss, hazards ?

- Key idea: Allow instructions behind stall to proceed:

```
DIVD  F0, F2, F4
ADDD  F10, F0, F8
SUBD  F12, F8, F14
```

- Or

```
LW    F0, 0(R1) # cache miss
ADDD  F10, F0, F8
SUBD  F12, F8, F14
```

- Out-of-order execution $\Rightarrow$ out-of-order completion.
- Disadvantages?
 - Complexity
 - Precise interrupts harder!
- Why in HW at run time?
 - Works when can't know real dependence at compile time
 - Compiler simpler
 - Code for one machine runs well on another

CS 152 L16 Adv. Pipe. 2 (4)

Patterson Fall 2003 © UCB

Scoreboard: a bookkeeping technique

- Out-of-order execution divides ID stage:
 1. Issue—decode instructions, check for structural hazards
 2. Read operands—wait until no data hazards, then read operands
- Instructions execute whenever not dependent on previous instructions and no hazards.
 - Scoreboards date to CDC 6600 in 1963
- CDC 6600: In order issue, out-of-order execution, out-of-order commit (or completion)
 - No forwarding!
 - Imprecise interrupt/exception model for now

CS 152 L16 Adv. Pipe. 2 (5)

Patterson Fall 2003 © UCB

Scoreboard Architecture(CDC 6600)

CS 152 L16 Adv. Pipe. 2 (6)

Patterson Fall 2003 © UCB

Scoreboard Implications

- Out-of-order completion => WAR, WAW hazards?
- Solutions for WAR:
 - Stall writeback until registers have been read
 - Read registers only during Read Operands stage
- Solution for WAW:
 - Detect hazard and stall issue of new instruction until other instruction completes
- Need to have multiple instructions in execution phase => multiple execution units or pipelined execution units
- Scoreboard keeps track of dependencies between instructions that have already issued.
- Scoreboard replaces ID, EX, WB with 4 stages
- Unlike newer techniques, no register renaming!

CS 152 L16 Adv. Page 2 (7)

Patterson Fall 2003 © UCB

Four Stages of Scoreboard Control

- **Issue**—decode instructions & check for structural hazards (ID1)
 - Instructions issued in program order (for hazard checking)
 - Don't issue if **structural hazard**
 - Don't issue if instruction is **output dependent** on any previously issued but uncompleted instruction (no WAW hazards)
- Example:
- ```
DIVD F0, F2, F4
ADDD F10, F4, F8
SUBD F0, F8, F14
```

CDC 6600 scoreboard would stall SUBD until DIVD completes

CS 152 L16 Adv. Page 2 (8)

Patterson Fall 2003 © UCB

## Four Stages of Scoreboard Control

- **Read operands**—wait until no data hazards, then read operands (ID2)
  - All real dependencies (RAW hazards) resolved in this stage, since we wait for instructions to write back data.
- Example:
 

```
DIVD F0, F2, F4
ADDD F10, F0, F8
SUBD F4, F8, F14
```

CDC 6600 scoreboard would stall ADDD until DIVD completes

- **No forwarding of data** in this model!
  - But it writes as soon as execution completes vs. delaying for extra stages

CS 152 L16 Adv. Page 2 (9)

Patterson Fall 2003 © UCB

## Four Stages of Scoreboard Control

- **Execution**—operate on operands (EX)
  - The functional unit begins execution upon receiving operands. When the result is ready, it notifies the scoreboard that it has completed execution.
- **Write result**—finish execution (WB)
  - Stall until no WAR hazards with previous instructions:

Example:

```
DIVD F0, F2, F4
ADDD F10, F4, F8
SUBD F8, F8, F14
```

CDC 6600 scoreboard would stall SUBD until ADDD reads operands

## Administrivia

- Design full cache, but only simulation on Friday 10/24; demo board Friday 10/31
- Thur 11/6: Design Doc for Final Project due
  - Deep pipeline? Superscalar? Out-of-order?
  - Read section 4.2 from CA:AQA 2/e
- Fri 11/14: Demo Project modules
- Wed 11/19: 5:30 PM Midterm 2 in 1 LeConte
- Tues 11/22: Field trip to Xilinx
- CS 152 Project week: 12/1 to 12/5
  - Mon: TA Project demo, Tue: 30 min Presentation, Wed: Processor racing, Fri: Written report

CS 152 L16 Adv. Page 2 (11)

Patterson Fall 2003 © UCB

## Three Parts of the Scoreboard

- **Instruction status:** Which of 4 steps the instruction is in
- **Functional unit status:**—Indicates the state of the functional unit (FU). 9 fields for each functional unit
  - Busy:** Indicates whether functional unit is busy or not
  - Op:** Operation to perform in the unit (e.g., + or −)
  - Fi:** Destination register for a F.U.
  - Fj,Fk:** Source-register numbers for a F.U.
  - Qj,Qk:** Functional units producing source registers Fj, Fk
  - Rj,Rk:** Flags indicating when registers Fj, Fk are ready for FU to ready them; if yes, others can't write
- **Register result status:**—Indicates which functional unit will write each register, if one exists. Blank when no pending instructions will write that register

CS 152 L16 Adv. Page 2 (12)

In-order issue; out-of-order execute & commit

## CDC 6600 Scoreboard

- Speedup 1.7 from compiler; 2.5 by hand BUT slow memory (no cache) limits benefit
- Limitations of 6600 scoreboard:
  - No forwarding hardware
  - Limited to instructions in basic block (small window)
  - Small number of functional units (structural hazards), especially integer/load store units
  - Do not issue on structural hazards
  - Wait for WAR hazards
  - Prevent WAW hazards
- Next time: out-of-order without limits of above

## Peer: SP v. SS v. Scoreboard (SB)

- Which are true? (SP = superpipeline, SC= superscalar)
  - A. SB should have a better clock rate vs. just SP
  - B. SB should have a better CPI vs. just SS
  - C. SB works better with SP than with SS
    - 1.ABC: FFF    5. ABC: TFF
    - 2.ABC: FFT    6. ABC: TFT
    - 3.ABC: FTF    7. ABC: TTF
    - 4.ABC: FTT    8. ABC: TTT

## Scoreboard Summary

- HW exploiting ILP (Instruction Level Parallelism)
  - Works when can't know dependence at compile time.
  - Code for one machine runs well on another
- Key idea of Scoreboard: Allow instructions behind stall to proceed (Decode => Issue instruction & read operands)
  - Enables out-of-order execution => out-of-order completion (but in order execution)
  - ID stage checked both for structural & data dependencies
  - Original version didn't handle forwarding.
  - No automatic register renaming = WAW, WAR stalls
