
CS152 – Computer Architecture and Engineering

Lecture 16 – Advanced Pipelining 2

2003-10-21

Dave Patterson

(www.cs.berkeley.edu/~patterson)

www-inst.eecs.berkeley.edu/~cs152/

Summary #1/2: Compiler techniques for parallelism

- Loop unrolling $\Rightarrow$ Multiple iterations of loop in SW:
 - Amortizes loop overhead over several iterations
 - Gives more opportunity for scheduling around stalls
- Very Long Instruction Word machines (VLIW)
 - $\Rightarrow$ Multiple operations coded in single, long instruction
 - Requires sophisticated compiler to decide which operations can be done in parallel
 - Trace scheduling $\Rightarrow$ find common path and schedule code as if branches didn't exist (+ add "fixup code")
- All of these require additional registers

Your Project Choice

- Superpipelined
- Superscalar
- Out-of-order execution

Reduce pipeline stalls for cache miss, hazards ?

- Key idea: Allow instructions behind stall to proceed:

```
DIVD    F0, F2, F4
ADDD    F10, F0, F8
SUBD    F12, F8, F14
```

- Or

```
LW      F0, 0(R1) # cache miss
ADDD    F10, F0, F8
SUBD    F12, F8, F14
```

- Out-of-order execution => out-of-order completion.
- Disadvantages?
 - Complexity
 - Precise interrupts harder!
- Why in HW at run time?
 - Works when can't know real dependence at compile time
 - Compiler simpler
 - Code for one machine runs well on another

Scoreboard: a bookkeeping technique

- **Out-of-order execution** divides ID stage:
 1. **Issue**—decode instructions, check for structural hazards
 2. **Read operands**—wait until no data hazards, then read operands
- Instructions execute whenever not dependent on previous instructions and no hazards.
 - Scoreboards date to CDC 6600 in 1963
- CDC 6600: In order issue, out-of-order execution, out-of-order commit (or completion)
 - No forwarding!
 - Imprecise interrupt/exception model for now

Scoreboard Architecture(CDC 6600)

Scoreboard Implications

- Out-of-order completion => WAR, WAW hazards?
- Solutions for WAR:
 - Stall writeback until registers have been read
 - Read registers only during Read Operands stage
- Solution for WAW:
 - Detect hazard and stall issue of new instruction until other instruction completes
- Need to have multiple instructions in execution phase => multiple execution units or pipelined execution units
- Scoreboard keeps track of dependencies between instructions that have already issued.
- Scoreboard replaces ID, EX, WB with 4 stages
- Unlike newer techniques, no register renaming!

Four Stages of Scoreboard Control

- **Issue**—decode instructions & check for structural hazards (ID1)
 - Instructions issued in program order (for hazard checking)
 - Don't issue if **structural hazard**
 - Don't issue if instruction is **output dependent** on any previously issued but uncompleted instruction (no WAW hazards)

Example:

```
DIVD F0, F2, F4  
ADDD F10, F4, F8  
SUBD F0, F8, F14
```

CDC 6600 scoreboard would stall SUBD until DIVD completes

Four Stages of Scoreboard Control

- **Read operands**—wait until no data hazards, then read operands (ID2)
 - All real dependencies (RAW hazards) resolved in this stage, since we wait for instructions to write back data.
 - Example:

`DIVD F0, F2, F4`
`ADDD F10, F0, F8`
`SUBD F4, F8, F14`

CDC 6600 scoreboard would stall ADDD until DIVD completes

- **No forwarding of data** in this model!
 - But it writes as soon as execution completes vs. delaying for extra stages

Four Stages of Scoreboard Control

- **Execution**—operate on operands (EX)
 - The functional unit begins execution upon receiving operands. When the result is ready, it notifies the scoreboard that it has completed execution.
- **Write result**—finish execution (WB)
 - Stall until no WAR hazards with previous instructions:

Example:

```
DIVD  F0, F2, F4  
ADDD  F10, F4, F8  
SUBD  F8, F8, F14
```

CDC 6600 scoreboard would stall SUBD until ADDD reads operands

Administrivia

- Design full cache, but only simulation on Friday 10/24; demo board Friday 10/31
- Thur 11/6: Design Doc for Final Project due
 - Deep pipeline? Superscalar? Out-of-order?
 - Read section 4.2 from CA:AQA 2/e
- Fri 11/14: Demo Project modules
- Wed 11/19: 5:30 PM Midterm 2 in 1 LeConte
- Tues 11/22: Field trip to Xilinx
- CS 152 Project week: 12/1 to 12/5
 - Mon: TA Project demo, Tue: 30 min Presentation, Wed: Processor racing, Fri: Written report

Three Parts of the Scoreboard

- **Instruction status:**

Which of 4 steps the instruction is in

- **Functional unit status:**—Indicates the state of the functional unit (FU). 9 fields for each functional unit

Busy: Indicates whether functional unit is busy or not

Op: Operation to perform in the unit (e.g., + or −)

Fi: Destination register for a F.U.

Fj,Fk: Source-register numbers for a F.U.

Qj,Qk: Functional units producing source registers Fj, Fk

Rj,Rk: Flags indicating when registers Fj, Fk are ready for FU to ready them; if yes, others can't write

- **Register result status**—Indicates which functional unit will write each register, if one exists. Blank when no pending instructions will write that register

Detailed Scoreboard Pipeline Control

Instruction status	Wait until	Bookkeeping
Issue	Not busy (FU) and not result(D) <i>(No structural hazard and no WAW hazard)</i>	$\text{Busy}(\text{FU}) \leftarrow \text{yes}; \text{Op}(\text{FU}) \leftarrow \text{op};$ $\text{Fi}(\text{FU}) \leftarrow \text{'D'}; \text{Fj}(\text{FU}) \leftarrow \text{'S1'};$ $\text{Fk}(\text{FU}) \leftarrow \text{'S2'}; \text{Result}(\text{'D'}) \leftarrow \text{FU};$ $\text{Qj} \leftarrow \text{Result}(\text{'S1'}); \text{Qk} \leftarrow \text{Result}(\text{'S2'});$ $\text{Rj} \leftarrow \text{not Qj}; \text{Rk} \leftarrow \text{not Qk};^*$
Read operands	Rj and Rk <i>(No RAW hazard)</i>	$\text{Rj} \leftarrow \text{No}; \text{Rk} \leftarrow \text{No}; \text{Qj} \leftarrow 0; \text{Qk} \leftarrow 0;$ <i>(Registers available for others to write)</i>
Execution complete	Functional unit done	
Write result	$\forall f((\text{Fj}(f) \neq \text{Fi}(\text{FU}) \text{ or } \text{Rj}(f) = \text{No}) \& (\text{Fk}(f) \neq \text{Fi}(\text{FU}) \text{ or } \text{Rk}(f) = \text{No}))$ <i>(No WAR hazard)</i>	$\forall f(\text{if } \text{Qj}(f) = \text{FU} \text{ then } \text{Rj}(f) \leftarrow \text{Yes});$ $\forall f(\text{if } \text{Qk}(f) = \text{FU} \text{ then } \text{Rj}(f) \leftarrow \text{Yes});$ $\text{Result}(\text{Fi}(\text{FU})) \leftarrow 0; \text{Busy}(\text{FU}) \leftarrow \text{No}$ <i>(For all other FUs, if waiting to for this FU to write register, mark source register ready. For this FU, reset destination, mark not busy)</i>

* (Issue bookkeeping: Mark FU busy, Mark FU operation, Set FU register numbers, Set result register status to being written by this FU, Copy register write status of source registers into Qj, Qk fields, Mark FU source registers as ready if no other FU is writing them)

Scoreboard Example

Instruction status:

Instruction	<i>j</i>	<i>k</i>	<i>Read</i>	<i>Exec</i>	<i>Write</i>
			<i>Issue</i>	<i>Oper</i>	<i>Comp</i> <i>Result</i>
LD	F6	34+	R2		
LD	F2	45+	R3		
MULTD	F0	F2	F4		
SUBD	F8	F6	F2		
DIVD	F10	F0	F6		
ADDD	F6	F8	F2		

Notes: 5 FU.

Integer includes LD,SD

Latency: Add 2,

Multiply 10, Divide 40

Functional unit status:

<i>Time</i>	<i>Name</i>	<i>Busy</i>	<i>Op</i>	<i>dest</i>	<i>S1</i>	<i>S2</i>	<i>FU</i>	<i>FU</i>	<i>Fj?</i>	<i>Fk?</i>

CDC 6600 Scoreboard

- Speedup 1.7 from compiler; 2.5 by hand
BUT slow memory (no cache) limits benefit
- Limitations of 6600 scoreboard:
 - No forwarding hardware
 - Limited to instructions in basic block (small *window*)
 - Small number of functional units (structural hazards), especially integer/load store units
 - Do not issue on structural hazards
 - Wait for WAR hazards
 - Prevent WAW hazards
- Next time: out-of-order without limits of above

Peer: SP v. SS v. Scoreboard (SB)

- Which are true? (SP = superpipeline, SC= superscalar)
 - A. SB should have a better clock rate vs. just SP
 - B. SB should have a better CPI vs. just SS
 - C. SB works better with SP than with SS
- | | |
|-------------|-------------|
| 1. ABC: FFF | 5. ABC: TFF |
| 2. ABC: FFT | 6. ABC: TFT |
| 3. ABC: FTF | 7. ABC: TTF |
| 4. ABC: FTT | 8. ABC: TTT |

Scoreboard Summary

- HW exploiting ILP (Instruction Level Parallelism)
 - Works when can't know dependence at compile time.
 - Code for one machine runs well on another
- Key idea of Scoreboard: Allow instructions behind stall to proceed (Decode => Issue instruction & read operands)
 - Enables out-of-order execution => out-of-order completion (but in order execution)
 - ID stage checked both for structural & data dependencies
 - Original version didn't handle forwarding.
 - No automatic register renaming = WAW, WAR stalls
