

# CS61C Midterm 1 Review

Summer 2004

Pooya Pakzad

Ben Huang

Navtej Sadhal

# Overview

- Number Representation
- C
- Memory Management
- MIPS Assembly

# Changing Bases

- A number in any base can be expanded to calculate its decimal representation:

$$123_7 =$$

$$FD_{16} =$$

# Changing Bases

- A number in any base can be expanded to calculate its decimal representation:

$$123_7 = (1 \times 7^2) + (2 \times 7^1) + (3 \times 7^0)$$
$$= 66_{10}$$

$$FD_{16} =$$

# Changing Bases

- A number in any base can be expanded to calculate its decimal representation:

$$\begin{aligned} 123_7 &= (1 \times 7^2) + (2 \times 7^1) + (3 \times 7^0) \\ &= 66_{10} \end{aligned}$$

$$\begin{aligned} FD_{16} &= (15 \times 16^1) + (13 \times 16^0) \\ &= 253_{10} \end{aligned}$$

# Field width

- An N digit number in base b:
  - $b^N$  possible values
- How many values in an 8-bit number?

# Field width

- An N digit number in base b:  
 $b^N$  possible values
- How many values in an 8-bit number?  
 $2^8 = 256_{10}$

# Shortcuts

- It is easy to change between bases that are a power of 2:

F00D<sub>16</sub>

# Numbers in a Computer

- Unsigned integers - nothing tricky
- Signed Integers
  - Sign-magnitude
  - 1's complement
  - 2's complement
- Overflow

# Signed Number Systems

Fill in the following decimal values for these systems (8 bit):

| Decimal | Sign Mag. | 1's Comp. | 2's Comp. |
|---------|-----------|-----------|-----------|
| 255     |           |           |           |
| 2       |           |           |           |
| 1       |           |           |           |
| 0       |           |           |           |
| -1      |           |           |           |
| -2      |           |           |           |
| -255    |           |           |           |

# Signed Number Systems

Fill in the following decimal values for these systems (8 bit):

| Decimal     | Sign Mag. | 1's Comp. | 2's Comp. |
|-------------|-----------|-----------|-----------|
| $127_{10}$  | 01111111  | 01111111  | 01111111  |
| $2_{10}$    |           |           |           |
| $1_{10}$    |           |           |           |
| $0_{10}$    |           |           |           |
| $-1_{10}$   |           |           |           |
| $-2_{10}$   |           |           |           |
| $-127_{10}$ |           |           |           |

# Signed Number Systems

Fill in the following decimal values for these systems (8 bit):

| Decimal     | Sign Mag.    | 1's Comp.    | 2's Comp. |
|-------------|--------------|--------------|-----------|
| $127_{10}$  | 01111111     | 01111111     | 01111111  |
| $2_{10}$    | 00000010     | 00000010     | 00000010  |
| $1_{10}$    | 00000001     | 00000001     | 00000001  |
| $0_{10}$    | [0 1]0000000 | [0 1]0000000 | 00000000  |
| $-1_{10}$   |              |              |           |
| $-2_{10}$   |              |              |           |
| $-127_{10}$ |              |              |           |

# Signed Number Systems

Fill in the following decimal values for these systems (8 bit):

| Decimal     | Sign Mag.    | 1's Comp.    | 2's Comp. |
|-------------|--------------|--------------|-----------|
| $127_{10}$  | 01111111     | 01111111     | 01111111  |

| $1_{10}$    | 00000001     | 00000001     | 00000001  |
| $0_{10}$    | [0 1]0000000 | [0 1]0000000 | 00000000  |
| $-1_{10}$   | 10000001     | 11111110     | 11111111  |
| $-2_{10}$   | 10000010     | 11111101     | 11111110  |
| $-127_{10}$ | 11111111     | 10000000     | 10000001  |

# Two's complement

- Benefits over SM and 1's:
  - Only one 0
  - Numbers go in simple unsigned order with discontinuity only at 0
- Extremes:
  - Highest value:  $2^{N-1}-1$
  - Lowest value:  $-2^{N-1}$

# Pointers in C

- Pointers
  - A pointer contains an address of a piece of data.
  - & gets the address of a variable
  - \* dereferences a pointer

```
int a;
```

```
int *b = &a;
```

```
int c = *b;
```

# Pointers

How would you create this situation in C without using malloc()?

```
struct Node {  
    int * i;  
    struct Node * next;  
};
```

# Pointers

```
struct Node {  
    int * i;  
    struct Node * next;  
};  
int main() {  
    struct Node a, b, c[5], d;  
    a.next = &b;  
    b.next = c;  
    c[0].next = &d;  
    return 0;  
}
```

# Pointers

How would you remove an element from a linked list given its value?

```
struct node {  
    int * i;  
    struct node * next;  
};  
typedef struct node Node;  
  
void remove( ... ){  
    ...  
}
```

# Pointers

```
int removeNode(Node **1stPtr, int toBeRemoved){
```

# Pointers

```
int removeNode(Node **l1stPtr, int toBeRemoved){  
    if ((*l1stPtr)==NULL) {  
        return 0;  
    } else if ((*l1stPtr)->i == toBeRemoved) {  
        *l1stPtr = (*l1stPtr)->next;  
        return 1;  
    } else {  
        return removeNode(  
            &((*l1stPtr)->next), toBeRemoved);  
    }  
}
```

# Malloc

- Allocates memory on the heap
- Data not disappear after function is removed from stack
- How to dynamically allocate an array of integers with a length of 10?

# Malloc

- Allocates memory on the heap
- Data not disappear after function is removed from stack
- How to dynamically allocate an array of integers with a length of 10?

```
int *i=(int *)malloc(sizeof(int)*10);
```

# Malloc

- Allocates memory on the heap
- Data not disappear after function is removed from stack
- How to dynamically allocate an array of integers with a length of 10?  
`int *i=(int *)malloc(sizeof(int)*10);`
- String of length 80?

# Malloc

- Allocates memory on the heap
- Data not disappear after function is removed from stack
- How to dynamically allocate an array of integers with a length of 10?

```
int *i=(int *)malloc(sizeof(int)*10);
```

- String of length 80?

```
char *str=(char*)malloc(sizeof(char)*81);
```

# MIPS Assembly

- Procedure call convention:
  - Arguments in \$a0,\$a1...
  - Return values in \$v0, \$v1...
  - Callee saved registers:
    - \$s0, \$s1... \$sp
  - Caller saved registers:
    - \$a0, \$a1..., \$t0, \$t1, ... \$v0, \$v1..., \$ra

# Translating from C to MIPS

Merge sort (Fall 2003 MT1)

```
struct node {  
    int value;  
    struct node *next;  
};
```

```
struct node *mergesort (struct node *list) {  
    if (list == 0 || list->next == 0)  
        return list;  
    return  
        merge(mergesort(evens(list)), mergesort(odds(list)));  
}
```

# Translating C to MIPS

mergesort:

```
    addi $sp, -12           # prologue:  
    sw $ra, 0($sp)  
    sw $a0, 4($sp)
```

# Memory Management

Stack: local variables, grows down

Heap: malloc and free, grows up

Static: global variables, fixed size

# Memory (Heap) Management

- When allocating and freeing memory on the heap, we need a way to manage free blocks of memory.
- Lecture covered two different ways to manage free blocks of memory.
  - Free List (first fit, next fit, best fit)
  - Buddy System

# Garbage Collection

- Garbage collection is used for cleaning up the heap. Sacrifices performance for automatic memory management.
- Lecture covered three different ways to garbage collect.
  - Reference Count
  - Mark and Sweep
  - Stop and Copy

# Reference Count

Root Set

# Reference Count

Root Set

# Reference Count

Root Set

Lots of overhead – every time a pointer changes, the count changes. Unused cycles are never retrieved!

# Mark and Sweep

Root Set

# Mark and Sweep

Root Set

# Mark and Sweep

Root Set

# Mark and Sweep

Root Set

# Mark and Sweep

Root Set

Requires us to stop every so often and mark all reachable objects (mark), then free all unmarked blocks (sweep). Once mark and sweep is done, unmark everything!

# Stop and Copy

Requires us to also stop every so often. But for stop and copy, we move the block to an empty portion of the heap. Pointers must be changed to reflect the change in block location.
